

NPI Addition: Maximum Training Length vs. Generalization

640 training additions per model | seed 1 | exact recursive execution | tested through 10,000 digits

Strict generalization frontier

Closed-loop sequence accuracy

Evaluation samples: 100 per length through 20 digits; 32 at 50 and 100; 2 at 500, 1,000, 3,000, and 10,000. The 10,000-digit point is a tested lower bound, not a proven maximum.
